WPI; 1995-082029/11. #X#X###X%XCCCCCCCCC

Stimulating neural cell out-growth and myelination - with pro:saposin, saposin C or new neurotrophic peptide(s) from cytokine(s), for treating nervous system diseases.

Disclosure, Page 32; 50pp; English.

The peptide given in AAR70773, corresponding to amino acids 8-29 of human saposin-C (AAR70784), promotes neurite outgrowth in vitro. A consensus sequence was determined by comparing the peptide with hematopoietic and neuropoietic cytokines, and neurotrophic peptides (AAR70774-82) were identified in the AB loop of human ciliary neurotrophic factor, interleukins-6, -2, -3 and -gamma, erythropoietin and leukocyte inhibitory factor, and in helix C of human interleukin-1-beta and oncostatin-M. Prosaponin (AAR7073) and saposin-C also promoted nerve cell myelination ex vivo. (Updated on 25-MAR-2003 to correct PN field.)

Prosaposin, saposin C and prosaposin derived peptides (prosaptides), have therapeutic applications in promoting recovery after toxic, traumatic, mycardial ishchemic, degenerative and inherited lesions to the peripheral and central nervous system. Prosaposin receptor agonists (PRAs) inhibit prohifiammatory cytokine-induced apoptosis by activation of the Ser/Thr protein kinase Akt. Akt dissociates complexes of Ed. 2 family members, such as BAD-BG1-2, releasing BC1-2 and its family members which inhibit caspases, thereby

cc inhibiting apoptosis. An additional mechanism whereby PRAs inhibit apoptosis is by blocking activation of JNK, a proapoptotic signaling component. Within several minutes after binding to the receptor, PRAs component. Within several minutes after binding to the receptor, PRAs block INK activation induced by tumor necrosis factor-alpha (INF alpha: Induced, as well as other proinflammatory cytokine-induced cappasse-mediated or induced by a proinflammatory cytokine-induced apoptosis. The method can be used for inhibiting apoptosis which is caspasse-mediated or induced by a proinflammatory cytokine, for example CT TNF alpha or interferon-gamma. It can be used for inhibiting apoptosis associated with a disorder such as e.g. rheumatoid arthitis, Crohn's cdisease, irritable bowel syndrome, asthma, cardiac infarction, congestive cdisease, irritable bowel syndrome, asthma, cardiac infarction, congestive collectes parkinson's disease, authoritoral leukoencephalitis, Alzheimer's disease, ischemic heart disease, Guillain-Barre disease, traumatic prain cord injury, traumatic spinal cord injury, alopecia, AlbS dementia, cerebral cord injury, traumatic spinal cord injury, alopecia, AlbS dementia, cerebral cord injury, traumatic spinal cord injury, alopecia, AlbS dementia, cerebral cord injury, traumatic spinal cord injury, alopecia, AlbS dementia, cerebral cord injury, traumatic spinal cord injury, alopecia, AlbS dementia, cerebral cord injury, traumatic spinal cord injury, alopecia, AlbS dementia, cerebral cord injury, and alopecia, and prosaposin receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

The sequence represents human Saponin C (SapC), an essential co-factor for the lygosomal enzyme glucocerebrosidase, GCB. GCB is the enzyme involved in Gaucher's disease, a lygosomal storage disease. The invention relates to introducing new glycosylation sites into lysosomal enzymes/activators like GCB to improve their bioactivity. The novel enzymes/activators like GCB to improve their bioactivity. The novel epytypeptides are used for the prevention and treatment of Gaucher's disease, Parber's disease, Parber's disease, Sarber's disease, Shindler disease, Hunter syndrome, Sly syndrome, Hurler and Huler/Scheie syndromes

Delivering pharmaceutical agent through membrane used for treating Gauchers disease, by applying composition comprising anionic phospholipids and fusogenic protein derived from prosaposin in carrier to Disclosure, Fig 4; 19pp, English. membrane

The invention describes a method of delivering a pharmaceutical agent through a membrane comprising applying to the membrane a composition (I) comprising: (1) anionic phospholipids; (2) a pharmaceutical agent contained within the phospholipids, and (3) a fusogenic protein or polypeptide derived from prosaposin in a carrier. The method can be used for delivering pharmaceutical agents through a biological membrane in cosmetic and medicinal applications, particularly for treating Gauchers disease. This is the amino acid sequence of sphingolipid activator protein C (saposin C) for use in the delivery composition 

```
The invention relates to a prosaposin receptor agonist comprising a defined amino acid sequence of 14-50 amino acids conforming to the consensus sequence appearing as ADQ94330. The agonists are based on peptides derived from the C domain of human presaposin (or homologous peptides from other proteins). Also included are a pharmaceutical composition comprising the prosaposin receptor agonist in a pharmaceutical carrier, a method of alleviating neuropathic pain in a subject, a method of inhibiting neurite outgrowth (or inhibiting neural cell death, promoting myelination or inhibiting demyelination) and a cell death, promoting myelination or inhibiting demyelination) and a method of inhibiting sensory or motor neuropathy. The neuropathic pain cell from a peripheral nerve disorder, e.g. neuroma, nerve compression, nerve crush, nerve stretch and incomplete nerve compression, nerve crush, nerve stretch and incomplete nerve compression, neave crush, nerve stretch, and encomplete from a disorder of dorsal root ganglia, spinal cord, brainstem, thalamus, or cortex. The prosaposin receptor agonist, composition, and methods are useful in
                                                                                   9
                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a agent comprising an inner leaflet component and a prosaposin-related polypeptide. The prosaposin-related polypeptide and a prosaposin-related polypeptide and a prosaposin-related polypeptide retains component is plasma-membrane affinity. The inner leaflet component is plasma-membrane affinity. The inner leaflet component is plasma-membrane affinity. The inner leaflet component in the agent promotes cell death in dislephatidylserine. The agent promotes cells of the agent can dislephatidylserine. The agent promotes cells of a subject; modulating be used in a method (M1) for modulating the distribution of an inner be used in a plasma membrane of a cell of a subject; modulating component in a pubject, treating (M3) cancer in a subject; modulation the plasma membrane is altered (preferably increased). The distribution the plasma membrane is altered (preferably increased). The distribution the plasma membrane is altered (preferably increased). The distribution the plasma membrane is altered (preferably selected from cells and cancer cells). In M2 and M3 the agent promotes cell (tumour cells and cancer cells). In M2 and M3 the agent promotes cell cancer in hyperproliferating cells which are preferably selected from sarccma, neuroblastoma, breast carcinoma, and squamous carcinoma cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New agent comprising an inner leaflet component (preferably plasma phosphatidylserine) and a prosaposin-related polypeptide with plasma membrane affility comprising a sequence of 524 or 80 amino acids, useful
                                                                                                                                                                   ö

The invention relates to pharmaceutical composition comprising a prosaposin receptor agonist and a carrier, where the composition is in a controlled release, liposomal or unit dosage form. The invention also controlled release, liposomal or unit dosage form. The invention also relates to prosaposin receptor agonists and the use of these agonists for myelinating neurite outgrowth, inhibiting neural demyelination and inhibiting sensory or myelination, inhibiting neural demyelination and inhibiting sensory or motor neuropathy. The pharmaceutical composition is useful for selevating neuropathy pain resulting from diabetes. The present sequence is human saposin C, which is derived from prosaposin. Note: The present sequence is given in the sequence listing, but is not further
New pharmaceutical composition comprising a prosaposin receptor agonist and a carrier, where the composition is in a controlled release, liposomal or unit dosage form, useful for alleviating neuropathic pain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 412; DB 9; Length 80;

are sphingolipid activator proteins or coenzymes that also promotes acid beta-glucosidase activity by inducing the enzyme conformational change at acidic ph. The methods and composition of the invention are useful for enhancing the transport and delivery of pharmaceutical agents across and/or within dermal and mucosal membranes for both cosmetic and medicinal applications such as in treating Gaucher's disease. The present sequence is human saposin C fusogenic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Translational profiling, expressed protein tag; EPT; kinase; phosphatase; protease; protease inhibitor; transporter; cytoskeletal protein; receptor; transcription factor; cancer; MTC; major histocompatability complex; myeloma; colon cancer; gastric cancer; adenocarcinoma; sarcoma; melanoma; lymphoma; leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this
                                                                                                                                                                                                                                                                        SDVYCEVCEFLVKEVTKLIDNNKTEKEILDAFDKMCSKLPKSLSEECQEVVDTYGSSILS

The invention relates to novel human diagnostic and therapeutic computation relates to novel human diagnostic and therapeutic polymucleotides designated dithp (ACG46080-ACC46749) and to their encoded polymucleotide sequences at least 90% identical to the dithp CDNA polymucleotide sequences at least 90% identical to the dithp CDNA polymucleotide sequences at least 90% identical to the dithp cells and sequences of the invention; recombinant vectors, host cells and sequences; the transgenic organisms comprising dithp nucleic acid sequences; methods of proteins increarrays comprising dithp nucleic acid sequences; methods of proteins increarrays comprising dithp nucleic acid sequences; methods of correcting which specifically bind a DITMP protein and methods of describing dithp nucleic acid sequences; methods of correcting dithp nucleic acid sequences and DITMP proteins may be used in the probe. Dithp nucleic acid sequences and DITMP proteins may be used in the probe. Dithp nucleic acid sequences and DITMP proteins may be used to disorders; and connective tissue disorders; proliferative disorders; autoimmune or inflammatory disorders; bused to disorders; nad connective tissue disorders; proliferative disorders; proliferative disorders; proliferative disorders; proliferative disorders; proliferative disorders; proliferative and connective tissue disorders; gastroincestinal disorders; proliferative of protein activity or gene expression. DITMP screen for modulators of protein activity or gene expression of a tissue or encil type and to induce antibodies. They dithp nucleic acids are a source of antisense sequences, as a source of mentioned above, as a source of antisense sequence, as a source of mentioned above, as a source of antisense sequence, as a source of the generation of transgenic animal models of human disease or knock in the persent sequence represents a DITMP protein which is involved in a The present sequence represents a DITMP protein which is involved in a prochemical pathway. Note: The sequence for thi

                                                                                                                                useful for preparing a composition for treating GENSET-
                                                                                                                                                                                    The invention relates to isolated GENSET polynuclectides and encoded polypeptides. The GENSET gene is useful for preparing a composition for treating GENSET-related disorders e.g., cancer. Sequences ABR39423-448 represent the novel GENSET polypeptide sequences

modulates the activity of a merical solution to the inversion traces.

Contacting step and determining whether test compound mediates the activity of the protease before and after contacting step and determining whether test compound modulates the extraction also relates to the proteins not previously identified as protease. The method is useful for identifying a compound that modulates the activity of a protease. It is useful for treating a disease or disorder e.g., cancer, immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases or metabolic disorders (preferably cancer of tissue or haematopoietic crigin) in mammal, preferably human. The method is also useful for treating disease, of the peripheral nervous system, Alzhelmer's disease, whiltiple sclerosis, amyotrophic lateral sclerosis, viral infections caused by prions, infections caused by bacteria and fissues and disorders, pain, sexual dysfuction, mood disorders, advantances and disorders, contained and disorders, and diso

The present sequence represents a human protein, which is used in the method of the Invention. The specification describes a method which uses at least one polypeptide or polymucleotide sequence belonging to the cat least one polypeptide or polymucleotide sequence belonging to the parallel of the retinol-binding plasma protein, precursor of the ganglioside GMZ activator, calgranulin B or saposin B protein of families. The method is used for detecting, preventing or treating a companies, polymucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple solerosis (in its various forms and companies). They may also be useful in cases of e.g. Alzhaimer's and parkinson's diseases, amyotrophic lateral solerosis, rheumatoid pertenting expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Translational profiling; expressed protein tag; EPT; kinase; phosphatase; protease inhibitor; transporter; cytoskeletal protein; receptor; transcription factor; cancer; MHC; major histocompatability complex; myeloma; colon cancer; gastric cancer; adenocarcinoma; sarcoma; melanoma; lymphoma; leukaemia.

The invention describes a purified polypeptide, which comprises a cramscription to kinase, phosphatase, protease, protease inhibitor, cramscription factor. The tramscription factor. The tramscription factor. The cramsporter, cytoskeletal protein, receptor or transcription factor. The cramsporter is useful as an immunogenic composition for eliciting in a polypeptide is useful as an immunogenic composition that pinds to the purified polypeptide, or the antibody that binds to this colypeptide, is useful for treating cancer. The polypeptide is also polypeptide, is useful for treating compounds that binds to a naturally processed class I MHC-binding polypeptide. The polypeptides and class I MHC-binding polypeptide. The polypeptides and polymucleotides are particularly useful for treating or preventing polymucleotides are particularly useful for treating or preventing compounds that binds are shown as are also useful for treating compounds that binds to screening agents for lymphoms or leukaemia. These are also useful for screening agents for captured above mentioned diseases. This sequence represents an treating the above mentioned diseases. This sequence for translational correction but was obtained in electronic format directly from WIPO at specification but was obtained in electronic format directly from WIPO at the printed profile to the printed profile pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma or

A Morita N.;

In Saposin-C from bovine spleen; complete amino acid sequence and

relation between the structure and its biological activity.";

Telation between the structure and its biological activity.";

Biochin. Biophys. Acta 1120:75-80(1992).

The sponential action of specific hydrolases. Some of these

by the sequential action of specific hydrolases. Some of these

c enzymes require specific low-molecular mass, non-enzymic proteins:

the sphingolipids activator proteins (coproteins) (By similarity).

the sphingolipids activator proteins (coproteins) (By similarity).

C elucosylceramide by beta-glucosylceramidase (EC 3.2.1.45) and

galactosylceramide by beta-galactosylceramidase (EC 3.2.1.46).

C saposin C apparently acts by combining with the enzyme and acidic

c lipid to form an activated complex, rather than by solubilizing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This Swiss-Prot entry is copyright. --- FUNCTION: Saposin B stimulates the hydrolysis of galacto-cerboside sulfate by arylaulfatase A (EC 3.1.6.8), GM1. cerebroside sulfate by larylaulfatase A (EC 3.2.1.23) and gangliosides by beta-galactosidase (EC 3.2.1.23) and gangliosides by beta-galactosidase A (EC 3.2.1.22). globotriaosylecramide by alpha-galactosidase A (EC 3.2.1.22). sphingolipid hydrolases (By similarity).

--- FUNCTION: Saposin B is a specific sphingomyelin phosphodiesterase activator (EC 3.1.4.12) (By similarity).

--- SUBCELLULAR LOCATION: Lysosomal.

--- SUBCELLULAR LOCATION: Lysosomal.

--- PTM: This precursor is proteolytically processed to 4 small peptides, which are similar to each other and are sphingolipid pydrolase activator proteins (By similarity).

C--- SIMILARITY: Contains 2 saposin A-type domains.

--- SIMILARITY: Contains 4 saposin B-type domains.
              Submitted (JAN-2000) to the EMBL/GenBank/DDBJ databases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Saposin A.

Sano A., Radin N.S., Johnson L.L., Tarr G.E.;
The activator protein for glucosylceramide beta-glucosidase from guinea pig liver. Improved isolation method and complete amino acid sequence.";
J. Biol. Chem. 263:19597-19601 (1988).
Saposin A and saposin C atimonale by beta-galactosylceramidase (EC 3.2.1.45).
Galactosylceramide by beta-galactosylceramidase (EC 3.2.1.46).
Saposin C apparently acts by combining with the enzyme and acidic saposin C apparently acts by combining with the proposition of the proposition of the complex of the complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 SDVYCEVÇEFLAKEVIKLIDNNKTEKEILDAFDKMCSKLPKSLSEEÇQEVVDTYGSSILS

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 3,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 3, Application US/08100247

Patent No. 5571787

GENERAL INFORMATION:

APPLICANT: O'BRIEN, JOHN S.

APPLICANT: C'RINCON, YASUO

TITLE OF INVENTION: PROSAPOSIN AS A NEUROTROPHIC FACTOR

NUMBER OF SEQUENCES: 5

CORRESPONDENCE ADDRESS:

ADDRESSEE: KNOBBE, MARTENS, OLSON AND BEAR

STREET: 620 NEWPORT CENTER DRIVE SIXTEENTH FLOOR

CITY: NEWPORT BRACH

STATE: CAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         STATE:
COUNTRY: USA
ZIP: 92660

ZIP: 92660

COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SISTEM: PC-DOS/MS-DOS
SOFTWARE: PARENTIN Release #1.0, Version #1.25

Patent No. 5700909

GENERAL INFORMATION:

APPLICANT: O'Brien, John S.

TITLE OF INVENTION: Brosaposin and Cytokine-Derived Peptides

TITLE OF INVENTION: As Therapeutic Agents

NUMBER OF SEQUENCES: 20

CORRESPONDENCE ADDRESS:

ADDRESSEE: Campbell & Flores LLP

STREET: 4370 La Jolla Village Drive, Suite 700

CITY: San.Dlego

STATE: California

COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DB 1; Length 523;

saponin precursor - rat
Nathernate names: cerebroside sulfate activator protein; co-beta-glucosidase; componential (SAP); sphingolipid activator protein A2; sulfated glycoprotein 1; sulfatide sulfat
N;Contains: prosaposin; saposin A; saposin B; saposin C; saposin D
C;Species: Rattus norvegicus (Norway rat)
C;Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 09-Jul-2004
C;Accession: A28716
B;Collard, M.W.; Sylvester, S.R.; Tsuruta, J.K.; Griswold, M.D.
